

Experiential Learning Project Assessment-I on “ Password Strength Analyzer Using Hashing” under the course

Python ProgrammingLanguage(N-PCCCM304P)

**Presented By
Ruchika R. Koche
USN No : CM25109
Sec : B**

**Under the Guidance
of
Mrs. Mayuri Getme**

**Session:2026-27 (ODD)
Department of CSE(AI&ML)**

**S. B. JAIN INSTITUTE OF TECHNOLOGY MANAGEMENT AND
RESEARCH,NAGPUR**

An Autonomous Institute, Affiliated to RTMNU, Nagpur

PROJECT OVERVIEW

PROBLEM STATEMENT & OBJECTIVES:

- **Password Strength Analyzer Using Hashing**

- Many users choose weak or commonly used passwords, creating security risks.
- The project analyzes password strength and uses hashing for security evaluation.

"Evaluate password security using hashing techniques."

ALGORITHM & FLOWCHART

- The algorithm defines the step-by-step process from password input to the final result.
- It includes checking characteristics, hashing, comparison, and strength evaluation..

ALGORITHM

- | | |
|----|--------------------------------|
| 01 | Input Password |
| 02 | Check Password Characteristics |
| 03 | Generate Hash |
| 04 | Compare with Common Passwords |
| 05 | Evaluate Strength |
| 06 | Display Result |

FLOWCHART

UNDERSTANDING OF PYTHON LOGIC

- Python is used for input, conditions, password checking, scoring, and hashing.
- The program uses if/else, functions/logic, and hashlib to generate the result. passwords

GITHUB

- GitHub is used to store the project code and track changes through meaningful commits.
- Individual contribution shows the specific work completed by each student.

REPOSITORY

A screenshot of a GitHub repository page. The browser address bar shows the URL: `github.com/ruchhiii/Password-Strength-Analyzer-Using-Hashing/commit/1bab1e70389bcb80adde6e99b9d0d1c41c185eb`. The page indicates "1 file changed" and shows a search bar for "Search within code". The file `python.py.txt` is selected, and its content is displayed in a dark-themed editor. The code is a Python script for password strength analysis, starting with `import hashlib` and `password=input("Enter password: ")`. It calculates a score based on password length and character types (uppercase, lowercase, digit, alphanumeric), then hashes the password using `hashlib.sha256` and prints the strength and hash.

COMMITTS

Thankyou
